Sequence 85, Application US/09485737B

Patent No. 6350860

GENERAL INFORMATION:
APPLICANT: Buyes, Marie-Ange
TITLE OF INVENTION: INTERFERON-gamma-BINDING MOLECULES FOR TREATING SEPTIC SHOCK,
TITLE OF INVENTION: UNGREEN US/09/485,737B

FILE REFERENCE: INNS:015
CURRENT PAPLICATION NUMBER: DS/09/485,737B

CURRENT FILING DATE: 2000-02-14

PRIOR FILING DATE: 1998-08-14

PRIOR FILING DATE: 1998-06-18

PRIOR FILING DATE: 1998-06-18

PRIOR FILING DATE: 1999-06-18

PRIOR FILING DATE: 1991-08-18

NUMBER OF SEQ ID NOS: 104

SOFFWARE: Patentin version 3.0

Batent No. 6830752

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: Bablon, Erwin

TITLE OF INVENTION: INTERFERON-gamma-BINDING MOLECULES FOR TREATING SEPTIC

TITLE OF INVENTION: SHOCK,

TITLE OF INVENTION: CACHEXIA, IMMUNE DISEASES AND SKIN DISORDERS

FILE REPREEMENTS: 1008:015

CURRENT APPLICATION NUMBER: US/10/071,485

CURRENT FILING DATE: 2002-02-07
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            582

                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 148, Application US/09136389
Patent No. 6146850
GENERAL INFORMATION:
APPLICANT: Better, Marc D.
APPLICANT: Carroll, Stephen F.
APPLICANT: Carroll, Stephen F.
TITLE OF INVENTION: Immunotoxins Comprising Ribosome-Inactivating TIMES OF INVENTION: Proteins
NUMBER OF SEQUENCES: 173
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  57.2%; Score 770; DB 2; Length 240; 56.4%; Pred. Pseudomonas sp

```
A novel recombinant DNA molecule which encodes a single chain fusion protein or antibody comprising the Pv region of both the light and heavy chains of an antibody comprising the Pv region of both the light and heavy chains of an antibody (Ab) fused together, and an effector molecule, where the fusion proteins or an be used in compositions or as an immunotoxin to inhibit tumour cell growth. The single chain antibody can be used to detect the presence or absence of cells bearing a cusful as multiple argeting moieties, providing at least 2 kinds of useful as multiple argeting moieties, providing at least 2 kinds of cusful as multiple argeting moieties, providing at least 2 kinds of the imaging of tumours when attached to a radiolabel and for the piological adignosis of tumours. Humanised antibodies are less immunogenic than the mouse MAbs B1, B3 and B5, making them more suitable or cytotoxin which then produces an immunotoxin capable of selectively correctoxin which then produces an immunotoxin capable of selectively correctoxin which then produces an immunotoxin capable of selectively correctoxin which these are both highly toxic compounds and so are correctorated domain II and III, single amino acid abbtitutions and addition of one or more sequences at the C-terminal end. The wild type C-terminal sequence of the Pseudomonas exotoxin is given in AAR95221
                                                                                                                                                                                                                                                                                                                                                       Single chain fusion proteins and antibodies - useful to diagnose and treat cancer, specifically bind Lewis(Y) related carbohydrate antigen.
                                                                                                                                                                                                                                                       Lee B, Willingham M;

The present sequence is a peptide that can be added to the C-terminal end of a Pseudomonas exotoxin (PB) to produce a modified PB. Claimed immunoconjugates comprise a therapeutic agent, such as PB or a cytotoxic fragment of PB, and an anti-mesothelin antibody, such as serve SS (see ABB76197), and are obtained by recombinant methods. The recombinant immunoconjugates are used in a claimed method for inhibiting the growth of a malignant cell that expresses mesothelin on its cell surface, especially in mesothelioma, ovarian cancer, stomach cancer or squamous cell cancer
                                 (PE). This sequence can be used in the method of the invention for recombinant Pseudomonas exotoxin (PE) having: (a) a recognition molecule that blinds to the target cell and is inserted in domain III after amino acid 600 and before amino acid 613 of the PE, and (b) a carboxy-terminal sequence of 4-16 amino acids that permits translocation of the PE into the cytosol of the target cell. The insertion of a recognition molecule allows selective killing of target cells without significant cytotoxicity
                   sequence represents a C-terminal fragment of a Pseudomonas exotoxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Exotoxin; Pseudomonas; immunotoxin; mesothelin; scFv; mesothelioma;

                                                                                                                                                                                                                                                                                          à
                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                This peptide is located at the C-terminal end of exotoxin A (FTA, see AAW76391) of Pseudomonas aeruginosa. The motif is important in the intracellular transport and cytotoxicity of ETA. Loss of REDL inhibits the ability of ETA to reach the cytoplasm. However, REDL can be substituted by KDEL (see AAW76396) without loss of cytotoxicity. The invention provides a means of delivering compounds to cells as conjugates with modified ETA. The modified ETA is able to cross membranes and deliver e.g. therapeutic agents to the cytoplasm, such as nucleic acids, peptides, peptide nucleic acids, single chain antibodies and tumour
                                                                                                                                                                                     Delivering compounds to cells as new conjugate with detoxified exotoxin A - able to cross membranes and deliver to the cytoplasm, e.g. nucleic acids, antibodies, tumour suppressors etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Methods for killing target cells - with recombinant Pseudomonas exotoxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

This invention describes a method in which a secretory IgA-mediated immune response is elicited in a subject. The method involves administering to at least 1 mucosal surface of the subject a non-toxic continuous sectorial A-like (PE-like) chimeric immunogen comprising a cell recognition domain of that binds to a cell surface receptor on the mucosal surface, a translocation domain comprising an amino acid sequence of PR domain II to effect translocation to a cell surface receptor on the epitope domain comprising an amino acid sequence of that encodes a composition comprising an endoplasmic reticulum (ER) foreign epitope, and a sequence encoding an endoplasmic reticulum (ER) cretention domain that comprises an ER retention sequence. Also described is a composition comprising secretory IgA antibodies that specifically crecognise an epitope of HVV-1. The method can be used for eliciting an immune response to pathogens, e.g. virus, bacteria or parasitic protozoa or to a cancer antigen. The antibodies produced can also be isolated and used, e.g. for affinity chromatography. The PE immunogens can be made by wholly recombinant techniques which allows insertion of existing variants of an epitope, or new variants of rapidly evolving epitopes. The PE can be engineered to alter the function of its domains, thereby providing a cell recognition domain that a ligand for a particular cell type. By providing a cell recognition domain that binds to a mucosal surface a secretory immune response involving IgA can be elicited. This sequence represents a cere provided in the protein endoplasmic reticulum (ER) retention domain motif
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New Pseudomonas exotoxin chimeric immunogens - comprise a foreign epitope for producing an immune response to pathogens, e.g. virus, bacteria or

New mutagenized interleukin 13 molecules for delivery of cytotoxins to

cells over expressing IL13 receptors.

The present invention describes targeting ligands which are mutagenized CC ILL3 (interleukin 13) molecules having one or more mutations in the C ILL3 (interleukin 13) molecules having one or more mutations in the domain that interacts with the hILL4 receptor subunit designated the 140 CC CM mutagenized bill and be used for delivering an effector molecule to a call bearing an ILL3 receptor. Where the effector molecule is a coll bearing an ILL3 receptor. Where the effector molecule is a cyctoxin, neoplastic cells (e.g. a glioma) can be killed or inhibited. The methods are used to target effector molecules to kidney cancers, to skin cancers (Kaposi's sarcoma) and to brain cancers (gliomas and constitution of the chimeric label can be used to detect the presence or absence of undicates the presence, absence, dauntify a cell or cells expressing an confidence the chimeric label localizes at the site of overexpression and confidence molecule is an antibody the chimeric molecule may act to the effector molecule is an antibody the chimeric molecule may act to contain and alized an antibody the chimeric molecule may act to the effector molecule is an antibody the chimeric molecule may act to antigened and direct an immune response toward target cancer cells. The antignal and antibody the chimeric molecule may act to antigened and antiger and antibody the chimeric molecule may act to antigened antigened to a drug such as vinblastine, and antigened and antigened to a drug such as vinblastine, and antigened to a drug such as vinblastine. doxorubicin, genistein, an antisense molecule, ribozymes or any other pharmacological agent to specifically target target cells over expressing IL13 receptors. The targeting ligands have increased specificity for cancer cells as compared to normal cells and are therefore very effective for specifically delivering effector molecules to various neoplasias. The for specifically delivering effector molecules to various neoplasias. The present sequence is used in the exemplification of the present invention Gaps . 0 100.0%; Score 20; DB 2; Length 4; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a non-toxic Pseudomonas exotoxin A-like (PE-like) chimeric immunogen. This PE-like immunogen can be used in vaccines and for producing antibodies against the non-mative epitope. It can be used for producing antibodies against the non-mative epitope. It can be used for producing an immune response to a pathogen, e.g. a virus.

Datecria or parasitic protozoa or a cancer antigen. The antibodies can used for used for e.g. affinity chromatography. The PE immunogens can be made by wholly recombinant techniques which allows insertion of existing variants of an epitope, or new variants of rapidly consertion of existing variants of engineered to alter the function of its domains, thereby providing a variety of activities, e.g. by replacing the native cell binding domain of PE A (domain Ia) with a ligand for a particular cell type. The immunogens can be targeted to bind to the particular cell type. The immunogens can elicit humoral, cell-mediated and secretory immune responses against the non-native epitope. This sequence represents a PE protein endoplasmic reticulum (ER) retention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The present invention provides novel methods of enhancing the intracellular delivery of nucleic-acid based drugs. These involve the use of formulations containing not only the nucleic acid of interest, but also a permeation enhancer such as captylic acid or capric acid. This is particularly useful for the delivery of drugs into the cells of the gastrointestinal tract, especially the small intestine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           XAGE-1; p9; p16; major histocompatibility complex; T lymphocyte; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Method for enhancing the intracellular delivery of a nucleic acid-based drug comprises administering in combination with an enhancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    prostate cancer; lung cancer; small cell carcinoma; non-small cell carcinoma; adenocarcinoma; ovarian cancer; breast cancer; glioblastoma; pancreatic cancer; real rangoma; melanoma; histocytic lymphoma; Ewing's sarcoma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to chimeric proteins comprising a non-toxic Pseudomonas exotoxin A (PE) and a Type IV pilin loop. The chimeric proteins are useful for eliciting an immune response in a host. They are also useful for preventing and treating infections of microorganisms, e.g. Pseudomonas aeruginosa, Neisseria meningitidis, Neisseria gonorrhoeae, Vibrio cholera, Pasteurella multocidam or Candida The himeric proteins and compositions are useful for diagnostic tests such as immunoassays, to detect the presence of microorganisms bearing a Type IV pilin loop sequence, or to determine whether a host has antisera against a Type IV pilin loop due to an infection. They can also be used to purify antibodies against the Type IV pilin loop sequence. The invention is also used in gene therapy. The present sequence is endoplasmic reticulum (ER) retention peptide used in the invention
                                                                                                                                                                                                                                                                            New chimeric proteins comprising a non-toxic Pseudomonas exotoxin A sequence and a Type IV pilin loop sequence, useful for preventing and treating infections of microorganisms, e.g. Pseudomonas aeruginosa,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 20; DB 5; Length 4; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                 The invention describes an isolated polypeptide (I) comprising xage-1 p9 or p16 protein (p99/p16P) which, when processed and presented in context of major histocompatibility complex molecules, activates T I Jumphocytes against cells which express p99/p16P. (I), a vector encoding the protein (II) or a composition containing (I) is useful for the manufacture of a (II) or a composition containing (I) is useful for the manufacture of a lung cancer from small cell carcinoma, non-small cell carcinoma, aguamous cell carcinoma, and adenocarcinoma, non-small cell carcinoma, aguamous cell carcinoma, rhabdomyosarcoma and osteosarcoma. The method involves Ewing's sarcoma, rhabdomyosarcoma and osteosarcoma. The method involves caministering (II) in a recombinant virus, or immunising the subject with an expression vector that expresses polypeptide comprising an epitope of pps and which is an autologous recombinant cell. The method is useful for containing the growth of a cancer cell expressing p9P on its exterior inhibiting the growth of a cancer cell expressing p9P on its exterior surface. (II) is useful for determining if a cell in the sample contains a contact than the testes, and determining if a cell in the sample contains of the transcript encoding p9P, or detecting p9P produced by the transcript encoding p9P, or detecting p9P produced by contacting RNA from the cell with a nucleic acid probe that specifically hybridisation, or comprises disrupting the cell preferably a lymph node and contacting a portion of the cranscript, where the method preferably a lymph node and contacting a portion of the cell contents with a chimeric molecule contacting a pation of the cell contents with a chimeric molecule contacting a pation of the cell contents with a chimeric molecule contacting a pation of the cranscript and a detectable label, where the targeting molety and a detectable label, where the targeting contacting the label bound to p9P.

This sequence represents a peptide that can be added to the C-terminal of the cell contacti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                               Polypeptide from xage-1 p9 or p16 protein, which is expressed by a gene expressed in multiple cancers useful for activating T lymphocytes against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pseudomonas exotoxin A; PE; type IV pilin loop; immune response; infection; gene therapy; antimicrobial; endoplasmic reticulum; ER; immunostimulant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            용
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  XXXX
                                                                                                                                                                                                                                                                         ö
                                                                 The invention relates to a novel antibody that specifically binds to the cancer antigen MUC-1. The antibody comprises a domain having a sequence of a polypeptide selected from 125 variable light (VL) to variable heavy (VH) domain, 3D VL or VH domain, AS VL or VH domain and C4 VL or VH domain. Antibodies of the invention are useful for detecting a cell bearing a WUC-1 antigen. The invention is useful for producing a variety of human or humanised antibodies or diabodies. The invention is also useful for treating cancer. The present sequence is endoplasmic retention peptide, used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          moiety
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention provides a chimeric molecule comprising a toxic moiety and a targeting moiety or a nucleic acid sequence encoding the chimeric molecule, for use in the manufacture of a medicament. The targeting moiety binds specifically to a cell surface receptor for interleukin-13 (IL-13). The molecule can be used for application to a respiratory tract of a mammal to alleviate symptoms of a TH-2-type cytokine mediated disorders e.g. allergy, asthma, excess mucus production, airway inflammation, airway hyper responsiveness, tuberculosis, formation of granulomas during tuberculosis, and respiratory tract symptoms of viral, bacterial, fungal and parasitic infections (e.g. leishmania, filiarsis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of chimeric molecule comprising a toxic moiety and a targeting moie binding to interleukin-13 receptor or a nucleic acid sequence encoding the molecule in the treatment of e.g. allergy and asthma.
                                                                                                                                                                                                                                                                         Gaps
detecting a cell bearing MUC-1 antigen, comprises variable light or variable heavy domains of antibodies 12E, 3D, AS or C4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Interleukin, IL-13, antiallergic; antiasthmatic; respiratory; PE; antinflammatory; tuberculostatic; antimicrobial; antibacterial; antiparasitic; virucide; fungicide; exotoxin.

The present invention relates to a new anti-CD22 antibody has variable light (VL) and variable heavy (VH) chains of the antibody RFB4. The anti-CD22 antibody is useful for the manufacture of a medicament for detecting or inhibiting growth of CD22+ cancer cell. The present sequence represents a carboxyl terminus sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New anti-CD22 antibody, useful for the manufacture of a medicament for detecting or inhibiting growth of CD22+ cancer cell, comprising variable heavy and light chains of RFB4 antibody.
                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present invention describes an isolated antibody that binds compositionally to a stalk of CD30 of a cell, or to an epitope destroyed specifically to a stalk of (eD30) from intact CD30. Also described:

(1) a composition comprising the antibody conjugated or fused to a composition comprising the antibody conjugated or fused to a composition comprising the antibody conjugated or to an epitope destroyed upon cleavage of eCD30 from inteact (D30: (3) an expression vector comprising the nucleac acid operably linked to a promoter; (4) inhibiting cromprising the nucleace cell; (5) detecting the presence of a CD30+ cell composition of a CD30+ cell composition of a CD30+ cancer cell; (5) detecting the presence of a CD30+ cell composition of a host cell expression the presence of a CD30+ cell configuration of a host cell expression of a CD30+ cell configuration of a host cell expression of a CD30+ cell configuration of a host cell expression of a CD30+ cell configuration of a not cell configuration of a container and an anti-CD30 antibody that binds specifically to a stalk of the present sequence is used in the composition of a cell, or to an epitope destroyed upon cleavage of sCD30 from configuration of the present sequence is used in the composition of the present sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                         New antibody that binds specifically to a stalk of CD30 of a cell, or to an epitope destroyed upon cleavage of soluble CD30 (sCD30) from intact CD30, useful for inhibiting the growth of a CD30+ cancer cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present invention provides bispecific single chain (bs-scFv) antibody molecules which may be used to treat various forms of cancer associated with the overexpression of the epidermal growth factor receptor (EGFR) family. The invention is useful for specifically delivering an effector molecule to a cell bearing a receptor from EGFR protein family chosen from EGFR, HERZ/neu, HERZ, and HERZ. The invention is useful in the treatment of cancer. The present sequence is Pseudomonas aeruginosa translocation signalling peptide. The peptide is used in the invention.
                                                                                                                                                                                                                                                      Novel bispecific antibody comprising first and second antibody joined to each other and having binding specificity to different epitopes of Epidermal Growth Factor Receptor protein, useful for treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present invention describes an isolated polypeptide (I) comprising an amino acid sequence selected from human breast cancer and salivary gland expression (BASE) proteins BASE1 and BASE2 (SEQ ID NOS:1 and 2), and their fragments and variants, which when processed and presented in the context of major histocompatibility complex (MHC) molecules, activates T lymphocytes against cells which express BASE1 or BASE2 (SEQ ID NOS:1 or 2). The human BASE gene is located on chromosome 20. (I) has cytostatic and immunostimulant activities, and can be used in gene therapy, and in radioimmunotherapeutic targeted therapy using antibodies against BASE polypeptides. The BASE polypeptides, nucleic acids, antibodies and compositions of the present invention can be used for the diagnosis and treatment of breast cancer. The present sequence represents a carboxyl termine peptide, which is given in the exemplification of the present New breast cancer associated gene, termed BASE (breast cancer and salivary gland expression), and the encoded polypeptide and associated reagents, useful in diagnosis and treatment of breast cancer. New isolated Fv protein comprises a variable region of a heavy chain and light chain of a monoclonal antibody that binds the antigen specifically bound by monoclonal antibody 8H9, useful for treating tumors, e.g. astrocytoma or globlastoma.

Disclosure; Page 32; 79pp; English.

Peeudomonas exotoxin (PE) A. PE-A has a molecular veight of 66 kD. It acts to inhibit protein synthesis in eukaryotic cells by inactivating the ADP-ribosylation of elongation factor-2. This protein was used in the production of an Py protein comprision avariable region of a heavy chain of a monoclonal antibody that binds the antigen specifically bound by monoclonal antibody 8H9 and a variable region of a light chain of the monoclonal antibody 8H9, and an effector molecule comprising a toxin, where the Fv protein specifically binds the epitope bound by monoclonal antibody 8H9, and an effector molecule comprising a toxin, where the Fv protein specifically binds the epitope bound by monoclonal antibody shall be appeared by the toxin is preferably a Beudomonas excloxin, selected from PB38, PE40, PB38KDEL, or PB38KDEL, the Fv protein comprising a Fv polypeptide comprising both the light and the heavy chains of an antibody that binds the antigen specifically bound by 8H9 and an effector molecule comprising a toxin covalently linked to the Fv polypeptide is useful for the manufacture of a medicament for the treatment of a tumour. The tumour includes breast cancer, a glioblastoma, a mixed glioma, an astrocytoma, This sequence represents a possible C-terminal extension of a native or a synovial sarcoma.

for New antibodies that specifically bind to cancer antigen MUC-1, useful fumor targeting, for inhibiting the growth or proliferation of cancer cells or as diagnostic agents to identify tumors and monitor levels of circulating antigen.

Disclosure; SEQ ID NO 12; 79pp; English.

The invention provides novel antibodies that specifically bind to the MUC -1 cancer antigen. Preferred single chain antibodies were obtained from a phage display library and were designated as 12E, 3D, A5, C4, B5, E1 and B9 ADZ21537-ADZ21543. The heavy chain variable regions (W1) and light chain variable regions (VL) of these antibodies are also provided ADZ21523-ADZ21536. The VH and VL domains govern the specificity and binding affinity of the antibodies and permit the construction of a

Sequence 4 AA;

cells bearing/displaying the antipen. The antibodies are useful targeting moieties for specifically directing imaging agents and various therapeutic moieties to a cancer. A claimed method of inhibiting the growth or proliferation of a cell bearing a MUC-1 antigen comprises contacting the cell with a chimeric molecule comprising an anti-cancer drug, a production, a radionuclide, a liposome comprising an anti-cancer drug, a produg on anti-cancer drug. The present sequence is that of an andoplasmic reticulum retention peptide that can be added to the Pseudomonas exotoxin A (PS) moiety of chimeric molecules of the invention. Note: this sequence is referred to as SEQ ID NO:12 on page 16 ADZ21534.
                                                                                                                                                                                                                                                                                                                                                                               ö

WPI; 2005-405363/41.

This sequence represents a fragment of Pseudomonas endotoxin (PE) which maintains the ability of the construct to translocate into the cytosol. The PE was used in conjunction with the antibody of the invention which specifically binds CD22. The antibody of the invention may be used in the generation of a chimeric molecule, which may also comprise a therapeutic moiety. The therapeutic moiety is preferably a Pseudomonas exotoxin (PE) A or its cytotoxic fragment or mutant, where the PE has a Gly, Ala, val, teu or III in place of Arg at position 490 of the 613 amino acids wild type PE sequence. The antibody and chimeric molecule are useful for the manufacture of a medicament to inhibit the growth of a CD22+ cancer cell, and thus are useful for treating cancer. New antibody that specifically binds CD22, useful for the manufacture of a medicament to inhibit the growth of a CD22+ cancer cell, thus useful for treating cancer. Disclosure; SEQ ID NO 6; 106pp; English.

Sequence 4 AA;

```
The invention describes an antibody (I) that specifically binds and is internalized into a prostate cancer cell, comprising an antibody that specifically binds an epitope that is specifically bound by an antibody charter of specifically binds an epitope that is specifically bound by an antibody charter from A31 (SEQ ID No. 28), MID12 (SEQ ID No. 23), MID12 (SEQ ID No. 24), OA12 (SEQ ID No. 28), MID12 (SEQ ID No. 27), and C10 (SEQ ID No. 28), MID13 (SEQ ID No. 28), MID13 (SEQ ID No. 28), MID13 (SEQ ID No. 28), MID14 (SEQ ID No. 27), and C10 (SEQ ID No. 28), MID15 (SEQ ID No. 27), and C10 (SEQ ID No. 28), MID15 (SEQ ID No. 29), MID15 (SEQ ID SEQ ID NO. 29), MID15 (SEQ ID SEQ ID NO. 29), MID15 (SEQ ID SEQ ID SEQ ID NO. 29), MID15 (SEQ ID SEQ ID SE

                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel method of screening for nucleic acids activity, apoptosis, and/or inhibition of proliferation of cancer cells. The invention also describes 1) a method for identifying mammalian transfectants expressing scFv-Fcs on their cell surfaces; 2) a method for antiching for variant proteins that bind to a molecule with different affinity than the original and 3) a group of mammalian cells displaying a group of at least 100 different recombinant human antibodies on their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     group of mammalian cells transfected with nucleic acids encoding at least 100 different scFv-Fcs, where the transfected cells express at least 100 different scFv-Fcs on their cell surfaces. The products of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cell surfaces, where a library of nucleic acids encoding the group of antibodies has been introduced into the cells via transfection using a vector that does not comprise sequences derived from vaccinia virus or a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           diseases. This sequence represents an endoplastic reticulum localization sequence which can direct a protein to be retained within a cell.

Endoplasmic reticulum retention signals include a mammalian signal (AAR95063), a bacterial signal (AAT05064) from Pseudomonas exotoxin, and a yeast signal (AAR95065). The signal may form part of a multidomain protein (see also AAR95051-58) that is used with an effector nucleic acid for the transfer of nucleic acids to targeted cells as a means of gene therapy. The endoplasmic reticulum retention signal functions to affect intracellular routing of the internalized protein/nucleic acid complex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid transfer system for gene therapy, e.g. against cancer - includes toxin translocation domain to target nucleic acid to specific

```
This peptide is located at the C-terminal end of exotoxin A (ETA, see AAW76391) of Pseudomonas aeruginosa. 4 Of the last 5 amino acids of the motif are important in the intracellular transport and cytotoxicity of ETA. Loss of REDL (see AAW76395) inhibits the ability of ETA to reach the cytoplaam. However, REDL can be substituted by KDEL (see AAW76396) without loss of cytotoxicity. The invention provides a means of delivering compounds to cells as conjugates with modified ETA is able to cross membranes and deliver e.g. therapeutic agents to the cytoplasm such as nucleic acids, peptides, peptide nucleic acids, single chain antibodies and tumour suppressors
                                                                                                                                                                                                                                              Delivering compounds to cells as new conjugate with detoxified exotoxin A - able to cross membranes and deliver to the cytoplasm, e.g. nucleic acids, antibodies, tumour suppressors etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Methods for killing target cells - with recombinant Pseudomonas exotoxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    100.0%; Score 20; DB 2; Length 5; 100.0%; Pred. No. 2e+06; ive 0; Mismatches 0; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               C-terminal fragment of pseudomonas exotoxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (USSH ) US DEPT HEALTH & HUMAN SERVICES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Chaudhary VK;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pseudomonas exotoxin; PE; cytotoxic.
                                                                                                                                                                                                                                                                                                                                               Disclosure, Page 8; 76pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 An novel recombinant DNA molecule which encodes a single chain fusion protein or antibody comprising the FV region of both the light and heavy claims of an antibody comprising the FV region of both the light and heavy chains of an antibody (Ab) flued together, and an effector molecule, where the fusion protein or ab binding specificity of monoclonal Ab (MAA) B1, B3 or B5, can be used for the production of such fusion proteins or antibody. The fusion proteins can be used in compositions as an immunotoxin to inhibit tumour cell growth. The single chain cantibody can be used to detect the presence or absence of cells bearing a subjody can be used to detect the presence or absence of cells bearing a clewis(Y) carbohydrate antigen in a patient. The antibodies are also cuseful as multiple targetting moieties, providing at least 2 kinds of biological activity. They can also be used in diagnostic assays and for the imaging of tumours when attached to a radiolabel and for the pathological diagnosis of tumours. Humanised antibodies are less cannow manion than the mouse MAADs B1, B3 and B5, making them more suitable control which then produces an immunotoxin capable of selectively or cytotoxin which then produces an immunotoxin capable of selectively control phtherial coxin. These are both highly toxic compounds and so are mointed deletions in domains II and III, single amino acid substitutions and capable of addition of one or more sequences at the C-terminal end
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                   Single chain fusion proteins and antibodies - useful to diagnose and treat cancer, specifically bind Lewis(Y) related carbohydrate antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

This sequence represents a C-terminal fragment of a Pseudomonas exotoxin killing a target cell, which comprises contacting the cell with the comprises contacting the cell with a recombinant Pseudomonas exotoxin (PE) having: (a) a recognition molecule that binds to the target cell and is inserted in domain III after amino acid 600 and before amino acid 613 of the PE, and (b) a carboxy-terminal sequence of 4-16 amino acids that permits translocation of the PE into the cycosol of the target cell. The insertion of a recognition molecule allows selective killing of target cells without significant cytotoxicity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a method in which a secretory IgA-mediated immune response is elicited in a subject. The method involves administering to at least 1 mucosal surface of the subject a non-toxic Pseudomonas exotoxin A-like (PE-like) chimeric immunogen comprising a call recognition domain of that binds to a cell surface receptor on the mucosal surface, a translocation domain comprising an amino acid sequence of PR domain II to effect translocation to a cell cytosol, a foreign epitope domain comprising an amino acid sequence of that encodes a foreign aptrope, and a sequence encoding an endoplasmic reticulum (ER) retention domain that comprises an ER retention sequence. Also described is a composition comprising secretory IgA antibodies that specifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Exotoxin A; chimeric immunogen; non-toxic; PE-like; vaccine; pathogen; antibody production; non-native epitope; immune response; antigen; cancer; parasite; cell binding domain; domain Ia; humoral; cell-mediated; secretory; IgA-mediated; mucosal surface; IgA antibody; retention domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pseudomonas exotoxin chimeric immunogens - comprise a foreign epitope producing an immune response to pathogens, e.g. virus, bacteria or

                                                                                                  of an epitope, or new variants of rapidly evolving epitopes. The PE can be engineered to alter the function of its domains, thereby providing a variety of activities, e.g. by replacing the native cell binding domain of PE A (domain Ia) with a ligand for a particular cell receptor, the chimera can be targeted to bind to the particular cell type. By providing a cell recognition domain that binds to a mucosal surface a secretory immune response involving IgA can be elicited. This sequence represents a PE protein endoplasmic reticulum (ER) retention domain motif
                   immune response to pathogens, e.g. virus, bacteria or parasitic protozoa or to a cancer antigen. The antibodies produced can also be isolated and used, e.g. for affinity chromatography. The PE immunogens can be made by wholly recombinant techniques which allows insertion of existing variants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes targeting ligands which are mutagenized domain that interaleukin 13) molecules having one or more mutations in the domain that interacts with the hIL14 receptor subunit designated the 140 kDa hIL14Rbeta subunit. A cytocoxic molecule covalently attached to a mutagenized hIL13 can be used for delivering an effector molecule to a cell bearing an IL13 receptor. Where the effector molecule is a cytocoxin, neoplastic cells (e.g. a glioma) can be killed or inhibited. The methods are used to target effector molecules to kidney cancers, to skin cancers (Kaposi's sarroma) and to brain cancers (gliomas and medulloblastomas). When the mutagenized cell is attached to a detectable label the chimeric label can be used to detect the presence or absence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tumour cells, or localize and/or quantify a cell or cells expressing an IL13 receptor. The label localizes at the site of overexpression and indicates the presence, absence, quantity or location of such cells. If
recognise an epitope of HIV-1. The method can be used for eliciting an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New mutagenized interleukin 13 molecules for delivery of cytotoxins to

This invention describes a non-toxic Pseudomonas exotoxin A-like (PE-like) chimeric immunogen. This PE-like immunogen can be used in vaccines and for producing antibodies against the non-native epitope. It can be used for producing an immune response to a pathogen, e.g. a virus, bacteria or parasitic processo or a cancer antigen. The antibodies can also be isolated and used for e.g. affinity chromatography. The PE immunogens can be made by wholly recombinant techniques which allows insertion of existing variants of an epitope, or new variants of rapidly evolving epitopes. The PE can be engineered to alter the function of its domains, thereby providing a variety of activities, e.g. by replacing the particular cell binding domain of PE A (domain la) with a ligand for a particular cell receptor, the chimera can be targeted to bind to the particular cell receptor, the munogens can alicit humoral, cell-engiated particular cell immunogens can alicit immoral, cell-engiated particular cell type. The immunogens can alicit immoral, cell-engiated
                                                                                                                                                                                                                                                                                                                     ö
the effector molecule is an antibody the chimeric molecule may act to enhance and direct an immune response toward target cancer cells. The mutagenized IL13s may be conjugated to a drug such as vinblastine, doxorubicin, genistein, an antiense molecule, riboxymes or any other pharmacological agent to specifically target target cells over expressing IL13 receptors. The targeting ligands have increased specificity for cancer cells as compared to normal cells and are therefore very effective for specifically delivering effector molecules to various neoplasias. The present sequence is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Exotoxin A; chimeric immunogen; non-toxic; PE-like; vaccine; pathogen; antibody production; non-native epitope; immune response; antigen; cancer; parasite; cell binding domain; domain la; humoral; cell-mediated; secretory; ER; endoplasmic reticulum; retention sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to chimeric proteins comprising a non-toxic Pseudomonas exotoxin A (PE) and a Type IV pilin loop. The chimeric proteins are useful for eliciting an immune response in a host. They are also useful for preventing and treating infections of microorganisms, e.g. Pseudomonas aeruginosa, Neisseria meningitidis, Neisseria gonorrhoeae, Vibrio cholera, Pasteurella multocidam or Candida. The folimeric proteins and compositions are useful for diagnostic tests such as immunoassays, to detect the presence of microorganisms bearing a Type IV pilin loop sequence, or to determine whether a host has antisera against a Type IV pilin loop due to an infection. They can also be used to purify antibodies against the Type IV pilin loop sequence. The invention is also used in gene therapy. The present sequence is endoplasmic reticulum (ER) retention peptide used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New chimeric proteins comprising a non-toxic Pseudomonas exotoxin A sequence and a Type IV pilin loop sequence, useful for preventing and treating infections of microorganisms, e.g. Pseudomonas aeruginosa,

The present invention provides bispecific single chain (bs-scFv) antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antibodies that specifically bind to cancer antigen MUC-1, useful for tumor targeting, for inhibiting the growth or proliferation of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Single chain antibody; MUC-1; tumor-associated antigen; antibody therapy; cytostatic.
                                                                                                                                                                                                                                                                                                 Novel bispecific antibody comprising first and second antibody joined to each other and having binding specificity to different epitopes of Epidermal Growth Factor Receptor protein, useful for treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                molecules which may be used to treat various forms of cancer associated with the overexpression of the epidermal growth factor receptor (EGFR) family. The invention is useful for specifically delivering an effector molecule to a cell bearing a receptor from EGFR protein family chosen from EGFR, HER2/neu, HER3 and HER4. The invention is useful in the treatment of cancer. The present sequence is Pseudomonas aeruginosa translocation signalling peptide. The peptide is used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel antibody that specifically binds to the cancer antigen MVC-1. The antibody comprises a domain having a sequence of a polypeptide selected from 12B variable light (VL) to variable heavy (VH) domain, 3D VL or VH domain, AS VL or VH domain and C4 VL or VH domain. Antibodies of the invention are useful for detecting a cell bearing a MVC-1 antigen. The invention is useful for producing a variety of human or humanised antibodies or diabodies. The invention is also useful for treating cancer. The present sequence is endoplasmic retention peptide, used in the invention

The invention provides novel antibodies that specifically bind to the MUC

1 cancer antigen. Preferred single chain antibodies were obtained from a

1 cancer antigen. Preferred single chain antibodies were obtained from a

2 phage display library and were designated as 12E, 3D, A5, C4, B5, B1 and

2 phage display library and were designated as 12E, 3D, A5, C4, B5, B1 and

2 phage display library and VL domaine regions (VH) and light

2 chain variable regions (VL) of these antibodies are also provided

3 brading affairty of the antibodies and permit the construction of a

3 contacting of antibodies that specifically target the MUC-1 antigen and

3 contacting the appecifically directing imaging agents and various

3 contacting the cell with a chimeric molecule comprising an anti-cancer drug, a prodrug or an anti-cancer drug, a prodrug or an anti-cancer drug, a prodrug or an anti-cancer drug. The present

2 sequence is that of an endoplasmic reticulum retention peptide that can

3 be added to the Pseudomonae exotoxin, A (PE) moiety of chimeric molecules

3 contacting the companiant reticulum retention peptide that can

4 be added to the Pseudomonae exotoxin, A (PE) moiety of chimeric molecules

5 contacting the appendication, but differs from the sequence given as SEQ ID NO:11 on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anti-prostate cancer-antibody related translocation peptide SEQ ID NO 18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel antibody that specifically binds and is internalized into prostate cancer cell, useful for inhibiting growth or proliferation of prostate cancer cell and for detecting prostate cancer cell.
cells or as diagnostic agents to identify tumors and monitor levels of circulating antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

specifically binds an epitope that is specifically bound by an antibody chosen from A33 (SEQ ID No. 23), M954 (SEQ ID No. 24), OA12 (SEQ ID No. 25), M10A12 (SEQ ID No. 25), M18TE2 (SEQ ID No. 27), and C10 (SEQ ID No. 28). Also described are: a chimeric molecule (C 27), and C10 (SEQ ID No. 28). Also described are: a chimeric molecule (II), comprising an effector attached to (I); a pharmaceutical comprising an effector attached to (I); a pharmaceutical (II) comprising an excipient and (I) or (II) detecting (M1) (C formulation (III) comprising an excipient and (I) or (II) with a chelate comprising an expression where the chelate binds to the epitope tag comprising a detectable group, where the chelate binds to the epitope tag comprising a detectable group; where the chelate binds to the epitope tag comprising a detectable group; a nucleic acid (IV) comprising a nucleic acid that the detectable group; a nucleic acid (IV) comprising (IV); a cell comprising (C 1); and a kit (VI) comprising a container containing (I); an a comprising a containing (I); a comprising a containing (II); an expression vector (V) comprising (IV); a cell comprising (C 1); and a kit (VI) comprising a containing (IV); a cell comprising (C 1); and a kit (VI) comprising a containing (IV); a cell comprising (C 1); and a kit (VI) comprising a containing (II) is useful for cell is a metaetatic cell or solid tumor cell. (II) is useful for cencer cell with (II); attached to a cytocoxin or radiomuclide. The cencer cell with (II) attached to a detectable label and detecting the growner cell with (II) attached to a detectable label and detecting the group cell comprise contacting the group cell contact cell with (II) attached to a detectable label. This is the amino acid sequence of a cell membrane translocation peptide used in the creation of single chain anti-prostate cancer-antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human leucocyte antigen; HLA; alpha-1 domain; alpha-2 domain; HLA-B27;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       keratin VI, diagnosis; treatment; HLA-dependent autoimmune disease;
Class I-associated autoimmune disease; iritis; uveitis; psoriasis;
Class II-associated autoimmune disease; rheumatic disease; arthritis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treatment and diagnosis of HLA-dependent autoimmune disease - using peptide(s) derived from HLA-B27 or human keratin VI, e.g. for iritis, uveitis, rheumatic disease etc.
nternalized into a prostate cancer cell, comprising an antibody that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The invention describes an antibody (I) that specifically binds and is

ö

administered intravenously, subcutaneously or intramuscularly, or to the mucosa (orally, or as nasal or pulmonary spray). This method results in antigens that are more specific than complete protein antigens, so provide a more exact classification of disease, and thus a more specific treatment. In the case of keratin-derived peptides, they also have better solubility. Compared with complete proteins, peptides are easier to prepare, do not require recovery from natural tissue or recombinant methods of production, have better storage stability when dry, are less likely to cause allergy and have a regulatory effect on the immune system

class I and II-associated autoimmune diseases, especially non-HLA-BIZ diseases (iritis, uveitis, psoriasis and rheumatic diseases such as arthritis, psoriatic arthritis or juvenile rheumatic diseases such as arthritis, psoriatic arthritis or juvenile rheumatic diseases such as BIZ diseases e.g. ankylosing spondyllis (AS). These fragments can be administered intravenously, subcutaneously or intramuscularly, or to the mucosa (orally, or as nasal or pulmonary spray). This method results in antigens that are more specific than complete protein antigens, so provide a more exact classification of disease, and thus a more specific treatment. In the case of keratin-derived peptides, they also have better solubility. Compared with complete proteins, peptides are easier to prepare, do not require recovering from natural tissue or recombinant methods of production, have better storage stability when dry, are less likely to cause allergy and have a regulatory effect on the immune system
AAW58992-W59001 are peptides isolated from the alpha-1 or alpha-2 domain of HLA-B27 or human keratin IV and are used in methods for diagnosis and/or treatment of HLA (human leucocyte antigen)-dependent autoimmune diseases. Such peptides have implications in the treatment of cases of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human leucocyte antigen, HLA; alpha-1 domain; alpha-2 domain; HLA-B27; keratin VI; diagnosis; treatment; HLA-dependent autoimmune disease; Class I -associated autoimmune disease; iritis; uveitis; psoriasis; Class II-associated autoimmune disease; rheumatic disease; arthritis; ankylosing spondylitis; antigen; regulator.

Retroviral recombination assays, systems and cells, useful for evaluating the risk of producing a replication-competent retrovirus from a retroviral-based vector.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method for detecting a retroviral genetic recombinant having gag and pol functions, involving a cell suspected of having a recombinant and propagating the recombinant in the presence of any necessary helper functions. This is useful as it enables the detection of vectors which are able to replicate in the host cell, and allows the production of vectors suitable for gene therapy. The present sequence is a peptide fragment used to demonstrate the method of

AAWS8992-W59001 are peptides isolated from the alpha-1 or alpha-2 domain of HLA-B27 or human keratin IV and are used in methods for diagnosis and/or treatment of HLA (human leucocyte antigen)-dependent autoimmune diseases. Such peptides have implications in the treatment of cases of class I and II-associated autoimmune diseases, especially non-HLA-B27 diseases (iritis, uveitis, psoriasis and rheumatic diseases such as

Treatment and diagnosis of HLA-dependent autoimmune disease - using peptide(s) derived from HLA-B27 or human keratin VI, e.g. for iritis, uveitis, rheumatic disease etc.

The invention relates to a method of screening for polypeptides that bind to an RNA comprising incubating an affinity-labelled RNA with a cytoplasmic extract, where the RNA is linked to an affinity-labelled oligonucleotide, isolating the affinity-labelled RNA, and identifying polypeptides bound to the affinity-labelled RNA. The method is useful in identifying polypeptide factors interacting with RNA. The polypeptide may be used for drug discovery and in preventing or treating diseases, e.g. HCV infection. The present sequence represents the amino acid sequence of a cell protein fragment extracted by a biotinylated hepatitis C virus
                                                                                                                                                                                                                                     Screening for polypeptides that bind to an RNA, useful for treating hepatitis C virus infection, comprises incubating an affinity-labeled RNA with a cellular extract, isolating the RNA and identifying polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Linear; epitope; 60 kD; Ro/SSA; La/SSB; autoantigen; B/F; G; 70 kD; nuclear ribonucleoprotein; nRNP; Sm B/B'; polypeptide; antigen; D; systemic lupus erythematosus; SLE; autoantibody; U4/U6; U5; B; B'; RNA polymerase III; U1; U2; Sjogrens syndrome; SS; human; vaccine; SS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The peptide is a fragment of the HLA B27 hypervariable region described in AAR50266. The peptide can be used for the diagnosis and treatment of autoimmune disorders, e.g. spondyloarthropies including uveitis and spondylitis associated with inflammatory bowel disease or psoriasis. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   affinity-labelled RNA; drug discovery; HCV infection; biotin labelled;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences given in AAR4331-562 are linear epitopes which are derived from the 60 kD Ro/SSA peptide, the La/SSB autoantigen, the 70 kD nuclear ribonucleoprotein (IRNP) and the Sm B/B' polypeptide. These antigens are common in systemic lupus earthematosus (SLB) and closely related disorders. The Ro/SSA family of proteins has been shown to have several molecular forms which are defined by the molecular weight of the antigen identified. The major form has a molecular weight of 60 kD and two additional forms have molecular weights of 52 and 54 kD. La/SSB is also a member of this group of autoantibodies and binds small RNAs with a polyuridine terminus. La/SSB is bound by a third of the anti-Ro/SSA precipitin positive sera. La/SSB has been shown to be a 46-50 kD monomeric phosphoprotein which associates with RNA polymerase III

Thankstipts. Anti-Sm antibodies may be directed against one or a combination of the polypeptides: B (26 kD), B' (27 kD), D (13 kD), E/F

(11 kD doublet) and G (less than 10 kD). These epitopes may be used for preventing, treating or screening autoimmune disorders, especially SLB or Siogrens syndrome (SS). They bind to a human autoantibody and may therefore be used as vaccines. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                    New linear epitope(s) for human auto-antibodies - from the Ro/SSA, La and Sm B/B' antigens and ribo:nucleoprotein, used for diagnosing and treating auto-immune disorders e.g. systemic lupus erythematosus.

the dipeptides Asp-Asp, Asp-Glu and Asp-Gln and the tripeptides Glu-Asp-
the dipeptides Asp-Asp, Asp-Glu and Asp-Gln and the tripeptides Glu-Asp-
the dipeptides Asp-Asp, Asp-Glu and Asp-Gln and the tripeptides Glu-Asp-
the Asp-Glu-Asp, Asp-Phe and Asp-Asp-Phe. They are derived from, or related
to Lys-Phe, Glu-Asp-Phe and Asp-Asp-Phe. They are derived from, or related
to, a claimed peptide (see AAW26556) from the transframe region (TFR) of
thiv-1 Gag-Pol polygrotein. Also claimed are: antibodies (Ab) reactive
with the TFR peptide, and (3) anti-idiotype antibodies (Ab) reactive
with Ab. The TFR peptide and related peptides are inhibitors of
retroviral, especially HIV-1, protease activity (and also block protease
meturation) so can be used: (1) to treat cells infected with retrovirus;
(2) to screen for other compounds having similar antiviral activity; (3)
to stabilise retroviral compounds for more general inhibition of
aspartyl proteases; and (5) to inhibit other aspartyl proteases. Since
the peptides competitively inhibit pothers aspartyl proteases.

They should not lead to rapid selection of viral variants that are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HIV; HIV-1; human immunodeficiency virus; env; pol; gag; nef; vpr; vpu; vif; tat; cytotoxic T lymphocyte; CTL; immune response; epitope; antigen; vaccine; HIV infection; immunisation; virucide.
New peptide from trans-frame region of retroviral protein - useful for inhibiting activity and maturation of retroviral, esp. HIV, protease, e.g. for treatment of infection and for screening for antiviral agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vaccine compositions comprising human immunodeficiency virus-1 (HIV-1) peptide groups, useful for vaccinating against HIV-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may compused for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, compositions. There is evidence that the immune response to whole compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen of an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of tumour-associated antigens, which therefore reduces the likelihood of compositions. Furthermore, immunosuppressive groups for inclusion in additional advantage of an group-based vaccine approach is the ability to composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response con immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response con possible with traditional approaches. ABP11501 to ABP25412 represent peptide sequences used in the exemplification of the present correspondences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  HIV; HIV-1; human immunodeficiency virus; env; pol; gag; nef; vpr; vpu; vif; tat; cytocoxic T lymphocyte; CTL; immune response; epitope; antigen; vaccine; HIV infection; immunisation; virucide.

The present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid

Claim 32; Page 304; 448pp; English.

```
The present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                         escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccines procedule advantage of an group-based vaccine approach is the ability to combosition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABP11501 to ABP25412 represent poptide sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       HIV; HIV-1; human immunodeficiency virus; env; pol; gag; nef; vpr; vpu; vif; tat; cytotoxic T lymphocyte; CTL; immune response; epitope; antigen; vaccine; HIV infection; immunisation; virucide.
                                                                        particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of

be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, callowing for immune secape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of tumour-associated antigens, which the use of groups hat may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar enginering of the response is not possible with traditional approaches. ABPRISGI to ABPRISGI.

The present peptide sequences used in the examplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAY66199-Y66413 are peptides derived from conserved portions of the HIV-1 genome which bind to different HIA alleles of MHC (major histocompatibility complex) Class I molecules. The peptides are used to construct targetting antigens comprising one or more peptides bound to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel methods for designing molecular conjugate therapeutics which are used for diagnosis, imaging and treatment against pathogens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HIV-1; MHC; major histocompatibility complex; Class I; HLA; human leukcoyte antigen; allele; binding; conserved; genome; peptide; targetting; toxic; drug; antibedy; antigen; antiviral; molecular conjugate therapeutic; diagnosis; treatment; pathogen; localisation; quantification; detection; infection; drug resistance;
                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ΰ

the corresponding MHC Class I molecule, which can be used to raise antibodies. The antibody may then be used as a targetting vehicle to deliver a potentially toxic drug to its target site of action, rather than administering it systemically, which may result in adverse side effects. The invention relates to improved methods for the design of confections caused by pathogens with a high mutation rate (such as HIV-1). This method involves identifying ornserved peptide-encoding regions among the general dentifying the Class I MHC molecules which occur with greatest frequency in a population of interest (e.g., human sub-populations), and determining which of the peptides bind to the Class I MHC molecules. The MHC-binding peptides and the construct targetting antigens, which are in turn used to produce targetting antigens, which are in turn used to produce targetting antigates, which are in turn used to broduce the invention and in situ detection of specific peptide-MHC Class I Complexes and also to detect and treat viral infection. The methods of the invention mitigate against the development of viral resistance to drugs and to the immunial person with the development of viral resistance to drugs and to the immunial person with the development of viral resistance to drugs and to the immunial person with the methods as well as providing a solution for the contact and treat viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Retroviral recombination assays, systems and cells, useful for evaluating the risk of producing a replication-competent retrovirus from a retroviral-based vector.
                                                                                                                                                                                                                                                                                                                                                                                                  targetting toxic compounds to destroy viruses sequestered in sites not accessible to T cells. In addition, the methods eliminate the virus, whereas current therapies only arrest viral replication. (Updated on 12-SEP-2003 to standardise OS field)

This invention describes a novel carbohydrolase AEB87861 which is capable of hydrolyzing amylopectin, starch, glycogen or amylose, or its derivative or fragment, comprising AEB87862 which encodes AEB87861 or its derivative or fragment, comprising AEB87862 which encodes AEB87861 or its derivative or fragment, 2) a transformed prokaryotic or enkaryotic cell expressing AEB87862 or its derivative or fragment e.g. Escherichia coli cancer and an enzyme having activity of hydrolyzing amylopectin, etarch, glycogen or amylose; 4) an enzyme produced by the method of 3), and 5) a composition comprising the enzyme. The composition and methods are useful for removing dextran or polysaccharide contaminants during sugar production. The novel enzyme inhibits the formation of dental plaque and eliminates previously formed plaque and this anticaries cativity is useful for anti-plaque compositions or mouthwashes. This sequence represents a conserved region of Klebsiella aerogenes
                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                carbohydrolase; LSA; hydrolysis; starch; polysaccharide; decontamination;

               genetic recombinant having gag and pol functions, involving a cell suspected of having a recombinant and propagating the recombinant in the presence of any necessary helper functions. This is useful as it enables the detection of vectors which are able to replicate in the host cell, and allows the production of vectors suitable for gene therapy. The present sequence is a peptide fragment used to demonstrate the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New proteins that hydrolyze amylopectin, starch, glycogen or amylose, useful for removing dextran or polysaccharide contaminants during sugar production, or for eliminating plaques or as mouthwash.
                                                                                                                                                                                                                                                                           Gapa

This invention describes a novel carbohydrolase AEBB7861 which is capable of hydrolyzing amylopectin, starch, glycogen or amylose, or its derivative or fragment. The invention also describes 1) a gene, or its derivative or fragment, comprising AEBB7862 which encodes AEB87861 or its derivative or fragment, comprising AEB87862 which encodes AEB87861 or its derivative or fragment e.g. Escherichia coli expressing AEB87862 or its derivative or fragment e.g. Escherichia coli capressing AEB87862 or its derivative or fragment e.g. Escherichia coli corp. plysS deposited with the accession number of KTC10573HP; 3) a starch, glycogen or amylose; 4) an enzyme produced by the method of 3) and 5) a composition comprising the enzyme. The composition and methods are useful for removing dextran or polyasccharide contaminants during are useful for removing dextran or polyasccharide contaminants during contaminates production. The novel enzyme inhibits the formation of dental plaque and eliminates previoualy formed plaque and this anticaries activity is useful for anti-plaque compositions or mouthwashes. This entitle acceptance represents a conserved region of Geobacillus stearothermophilus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

New peptide(8) based on Class I HLA antigen domains - used for modulating cytotoxic T-lymphocyte activity towards targets.
                                                                                                                                                                                                                                                                                                                                                                                The peptide is used to modulate cytotoxic T-lymphocyte (CTL) activity, either by inhibition or stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL activity in parasitic diseases and neoplasta and in studies on viral infection. The peptide can also be used for identifying CTLs which bind to it and removing subsets of CTLs from a T-cell composition. This peptide sequence is more commonly found within larger peptide compounds of not more than 30 amino acids in length. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytotoxic T lymphocyte, CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.

The invention also describes 1) a gene, or its derivative or fragment, comprising AB87862 which encodes AE887861 or its derivative or fragment; 2) a transformed prokaryotic or eukaryotic cell expressing AE887862 or its derivative or fragment e.g. Escherichia coll B121 (DES) plysS deposited with the accession number of KCTC10573HP, 3) an method of producing an enzyme having activity of hydrolyzing amylopectin, et acemposition comprising the enzyme. The composition and methods are useful for removing dextran or polysaccharide contaminants during plaque and eliminates previously formed plaque and this anticaries activity is useful for anti-plaque compositions or mouthwashes. AAR83061-R83085, AAR83090-R83096 and AAR92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmarched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient
                                          Extension of acceptance period of transplants from MHC unmatched donor hosts - using Class I B75-84 MHC antigen of the recipient host.
                                                                                                                          Example 14; Page 34; 80pp; English.

Patent No. 5821238;
GENERAL INFORMATION:
APPLICANT: Pastan, Ira H.
TITLE OF INVENTION: Recombinant Pseudomonas Exotoxin with
TITLE OF INVENTION: Increased Activity
NUMBER OF SEQUENCES: 16
CORRESPONDENCE ADDRESS:
ADDRESSE: Townsend and Townsend and Crew
STREET: One Market Plaza, Steuart Street Tower
CITY: San Francisco
STATE: California
COUNTRY: USA
                                                                                                                                                                                                                                                                              100.0%; Score 20; DB 1; Length 4; 100.0%; Pred. No. 4.6e+05; tive 0; Mismatches 0; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        COMPUTER READABLE FORM:

Sequence 5, Application US/08776271

Patent No. 6083502

GENERAL INFORMATION:

APPLICANT: Pastan, Ira

APPLICANT: Chang, Kai

TITLE OF INVENTION: Mesothelium, Mesothelium, Mesothelium, Mesothelium and Ovarian Cancers

TITLE OF INVENTION: and Methods and Kits for Targeting the Antigen

NUMBER OF SEQUENCES: 8

CORRESPONDENCE ADDRESS: 8

STREET: Two Embarcadero Center, Eighth Floor

CITY: San Francisco

STATE: California

Sequence 13, Application US/09397951
Patent No. 6074644
GENERAL INFORMATION:
APPLICANT: Pestan, Ira
APPLICANT: Kuan, Chien-Tsun
TITLE OF INVENTION: Immunocoxin Containing a
TITLE OF INVENTION: Disulfide-Stabilized Antibody Fragment Joined to a
TITLE OF INVENTION: Pseudomonas Exotoxin that Does No. 6074644 Require Proteolytic
TITLE OF INVENTION: Activation
NUMBER OF SEQUENCES: 13
CORRESPONDENCE ADDRESS:
ADDRESSEE: Townsend and Townsend and Crew LLP
STREET: TWO Embarcadero Center, Eighth Floor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1.1. Application US/09047148

Patent No. 6086900
GENERAL INFORMATION:
APPLICANT: Darger, Rockford
TITLE OF INVENTION: METHODS AND COMPOSITIONS FOR USING
TITLE OF INVENTION: MEMBRANE-PENETRATING PROTEINS TO CARRY MATERIALS ACROSS
TITLE OF INVENTION: CELL MEMBRANES
NUMBER OF SEQUENCES: 13
CORRESPONDENCE ADDRESS:
ADDRESSEE: Arnold, White & Durkee
STRRET: P.O. Box 4433
